

Healthcare Quality Performance Report

Prepared by: Chloe Sequeira

Objective

Evaluate relationships between patient experience measures and hospital quality outcomes using CMS Hospital General Information and HCAHPS data.

Methods

Public CMS datasets were imported and merged in SAS using Facility ID. Descriptive statistics, correlation analysis, and logistic regression were used to assess associations between patient experience ratings and overall hospital performance.

Key Findings

- Total hospitals analyzed: 2,929
- Acute Care–Veterans Administration hospitals had the highest average overall rating (4.15)
- Patient survey ratings showed a moderate positive correlation with overall hospital ratings ($r = 0.41$, $p < .0001$)
- Each 1-star increase in patient survey rating was associated with 2.08 times greater odds of being a highly rated hospital (OR = 2.08, 95% CI: 1.91–2.25, $p < .0001$)

Operational Recommendations

- Monitor patient experience metrics routinely
- Use patient feedback to identify quality improvement opportunities
- Prioritize communication and patient engagement initiatives
- Integrate patient experience metrics into quality reporting workflows

Conclusion

Patient experience measures demonstrated meaningful associations with overall hospital performance and may provide useful information for healthcare quality monitoring and operational decision-making.
